

Sprint Review 5

- Features implemented = This sprint, we had a stronger focus on making UI more appealing, since we have our presentation on April 25th. However, we also added a lot to Poppin's functionality. We completed features for the follow button, image uploading, profile bio, profile featured posts, and comments.
- Issues fixed = We had a problem where a user's created posts weren't saving in the database, which created errors in re-rendering these posts on a user's profile. We managed to solve this issue by modifying some of the backend code.
- Implementation review = A challenge this sprint was getting our test files to run, which required us to learn more about mocking and to improve our original code to be better tested. We were able to write 5 successful unit tests, and even have errors displayed in the UI.
- Changes made = Our sequence diagram document comment was addressed, and we updated our product backlog to reflect our progress.
- Plans for next sprint = N/A. See Future Plans document.
- Scrum Review = Our scrum master (Monica) made the documents and managed them. She will also send the draft and final submissions and upload them to Github. Our product owner (Brett P) managed GitHub, checked for merge and pull requests, and reviewed the quality of tests and documents. Our development team made the progress below:
 - Brett - Improved UI for the profile page, finished the bio feature, improved general UI, and wrote test files for Login and Register.
 - Monica - Finished featured selected posts on profile by altering format, wrote test files for Rating and Caption.
 - Emmanuelle- Saved the follow button in the database, attached it with each username, and connected each comment with their username.
 - Wesley - Added a way to upload image URLs to the database and display them on posts. Updated the Posts UI to match the SRS document. Fixed a bug with updating the user's posts array in the database. Wrote a test file for Tags.
